

Problem Statement

Background

Natural disasters such as floods, cyclones, earthquakes, landslides, and wildfires occur frequently across the world. During these emergencies, people often face difficulties in obtaining immediate help, accurate information, medical assistance, and safe shelter.

Most existing emergency response systems depend heavily on manual communication, which leads to delays in rescue operations and increases the risk to human lives.

Existing System

Current disaster response systems have several limitations:

- Delayed emergency response
- Lack of centralized rescue coordination
- No intelligent emergency guidance
- Difficulty in locating nearby shelters
- Limited access to first-aid information
- Poor communication between citizens and rescue authorities

Proposed System

ResQAI is an AI-powered disaster response platform that provides intelligent emergency assistance using IBM Cloud technologies.

The platform allows users to:

- Chat with an AI emergency assistant
- Receive disaster-specific safety guidance
- Generate SOS requests
- Find nearby shelters and hospitals
- Access first-aid instructions
- Generate AI-powered disaster reports
- Assist rescue teams through a centralized dashboard

Objectives

- Reduce disaster response time.
- Improve communication during emergencies.
- Provide AI-powered emergency guidance.
- Help rescue teams prioritize rescue operations.
- Save lives through intelligent disaster management.

Scope

The platform can be used by:

- Citizens
- Rescue Teams
- Government Authorities
- NGOs
- Hospitals
- Disaster Management Agencies

Expected Benefits

- Faster emergency response
- Better rescue coordination
- Reduced confusion during disasters
- Improved public safety
- Efficient disaster management
